

SRPE-30E1A0 Series

Non-Isolated DC-DC Converter

The Bel SRPE-30E1A0 is part of the non-isolated DC-DC converter Power Module series. The modules use a Vertical SMT package. These converters are available in a range of output voltages from 0.6 VDC to 2.0 VDC over a wide range of input voltage ($V_{in} = 4.5 - 13.2$ VDC).

Key Features & Benefits

- 4.5 VDC – 13.2 VDC Input
- 0.6 VDC – 2.0 VDC / 30 A Output
- Non-Isolated
- Wide Output Trim Range
- Fixed frequency
- Output Over-Voltage Shutdown
- High efficiency
- OCP/SCP
- High Power Density
- Power Good Signal
- Overtemperature Shutdown
- Remote Sense
- Wide Input Voltage Range
- Remote On/Off
- Low Cost
- Undervoltage lockout
- Wide Operating Temperature Range (0 °C - 50 °C)
- Class II, Category 2, Non-Isolated DC/DC Converter (refer to IPC-9592B)

Applications

- Networking
- Computers and Peripherals
- Telecommunications

NOTES AND VALUES IN TESTING:

is: Input Reflected Ripple Current

ic: Input Terminal Ripple Current

Ls: Simulated Source Impedance (1 μ H)

Cs: Offset possible source Impedance (100 μ F, ESR<0.2 Ω @ 100kHz, 20 °C)

Cin: Electrolytic capacitor, should be as closed as possible to the power module to swallow ic ripple current and help with stability. Recommendation: 100 μ F, ESR<0.2 Ω @ 100kHz, 20 °C.

Below measured waveforms are based on above simulated and recommended inductance and capacitance.

14. TRIM

Output Voltage Set-Point Adjustment

Maximum trim up voltage is 2V.

Minimum trim up voltage is 0.6V.

Trim up circuit (using an external resistor)

Equations for calculating the trim resistor are shown below.

The Trim Up resistor should be connected between the Trim pin and the GND.

SRP1-30E1A0 Trim up Resistor Calculate

Unit: KΩ

Vo is the desired output voltage

Rtrimup is the required resistance between TRIM and GND

$$R_{trimup} = \frac{1.2}{V_o - 0.6}$$

Trim up circuit (using external PWM signal)

Equations for calculating the duty cycle are shown below

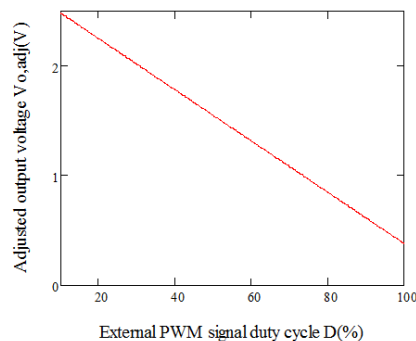

$$V_o(D) = 2.72 - 0.0234D$$

SRP1-30E1A0 Trim up duty cycle Calculate Unit: %

Vo is the desired output voltage

D is the external PWM signal duty cycle.

15. OCP

To provide protection in a fault output overload condition, the module is equipped with internal current-limiting circuitry and can endure current limiting for a few milli-seconds. If the overcurrent condition persists beyond a few milliseconds, the module will shut down into hiccup mode and restart once every 40mS. The module operates normally when the output current goes into specified range. The typical average output current is 4A during hiccup.

16. POWER GOOD

1. This module has a power good indicator output. Power good pin used positive logic and is open collector.
2. The maximum voltage pulled up externally on Power Good pin should not exceed 7V.
3. If the output voltage becomes within +10% and -5% of the target value, internal comparators detect power-good state and the power-good signal becomes high after a 1ms internal delay.
4. If the output voltage goes outside of +15% or -10% of the target value, the power-good signal becomes low after two microsecond (2- μ s) internal delay.
5. The pull up resistance must be larger than 10 kOhm.

17. SOLDERING INFORMATION

The SRPE-30E1A0 modules are designed to be compatible with reflow soldering process. The suggested Pb-free solder paste is Sn/Ag/Cu(SAC). The recommended reflow profile using Sn/Ag/Cu solder is shown in the following. Recommended reflow peak temperature is 245°C while the part can withstand peak temperature of 260°C maximum for 10 seconds. This profile should be used only as a guideline. Many other factors influence the success of SMT reflow soldering. Since your production environment may differ, please thoroughly review these guidelines with your process engineers.

18. MSL RATING

The SRPE-30E1A0 modules have a MSL rating of 3.

19. STORAGE AND HANDLING

The SRPE-30E1A0 modules are designed to be compatible with J-STD-033 Rev: A (Handling, Packing, Shipping and Use of Moisture /Reflow Sensitive surface Mount devices). Moisture barrier bags (MBB) with desiccant are applied. The recommended storage environment and handling procedure is detailed in J-STD-033.

20. PRE-BAKING

This component has been designed, handled, and packaged ready for Pb-free reflow soldering. If the assembly shop follows J-STD-033 guidelines, no pre-bake of this component is required before being reflowed to a PCB. However, if the J-STD-033 guidelines are not followed by the assembler, Bel recommends that the modules should be pre-baked @ 120~125°C for a minimum of 4 hours (preferably 24 hours) before reflow soldering.
